No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The polypeptides, which affect blood coagulation and platelet aggregation system, are useful in therapy and diagnostics. The polypeptides are also useful as an educational tool in laboratory practical kits for courses related to genetics and molecular biology, protein chemistry and antibody production and analysis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New pigmy rattlesnake (Sistrurus miliarius) venom gland proteins, which affect blood coagulation and platelet aggregation system, useful in therapy and diagnostics, or as tools in the study of genetics or

                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a new Deinagkistrodon actus anti-thrombosis enzyme, where the enzyme hydrolyses fibrin, dissolves blood clots and prevents platelet aggregation. The anti-thrombosis enzyme was administered to rabbits intravenualy. Thrombosis was determined before and after the administration at 0.5, 1.0, 2.0 and 3.0 hours by the chandler method. The enzyme showed anti-thrombosis activity at 0.5 hour following administration at 0.005 micro/kg and this activity was increased significantly at 1.0 hour and at 0.01 micro /kg. The composition is useful for preventing and treating vaso-occulusive and thrombosis, on significantly at 1.0 hour and at 0.01 micro /kg. The composition is useful for preventing and treating vaso-occulusive and thrombosis, including myocardial infarction, restenosis, angiopathic thrombosis, cerebral thrombosis, ischaemic cerebral vascular diseases, unstable agina, acute thrombosis, instable stenocardia, thrombosis, pulmonary embolism, deep vein thrombosis, peripheral arterial occulsion, stroke. It is also useful for treating atherosclerosis, oceans and inflammation, cancer and neurodegenerative diseases. The present sequence represents cDNA encoding the Deinagkistrodon acutus antithrombosis enzyme alpha chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 TGCACGAAGCAGGTGAACGGGGGGCATCTGGTCTTCTATCGAAAGCTCCGGAGAAGCAGAC 120

```
polynucleotide or polypeptide can be used as standards or as unknowns for testing purposes. The polypeptides are also useful in identifying proteins by western blotting, protein purification, determining the weight of expressed polypeptides as a ratio to total protein expressed, identifying peptide cleavage sites, coupling amino and carboxyl terminal tags, mass spectrometry, circular dichroism to determine conformation or affinity chromatography columns to purify the protein, cloning or sequencing. The present sequence is Sistrurus miliarius venom gland protein, Zsnk3 gene.

The polypeptides, which affect blood coagulation and platelet aggregation system, are useful in therapy and diagnostics. The polypeptides are also useful as an educational tool in laboratory practical kits for courses related to genetics and molecular biology, protein chemistry and antibody production and analysis. The

Salmorin protein is composed of an A chain and a B chain, and has inhibitory activity against fibrinogen clotting. The salmorin protein of the invention is useful for treating thrombosis, as it represses fibrinogen clotting potently by binding to prothrombin and thrombin so as to delay blood coagulation. The present cDNA sequence encodes the Korean adder salmorin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            231

polynucleotide or polypeptide can be used as standards or as unknowns for testing purposes. The polypeptides are also useful in identifying proteins by western blotting, protein purification, determining the weight of expressed polypeptides as ratio to total protein expressed, identifying peptide cleavage sites, coupling amino and carboxyl terminal tags, mass spectrometry, circular dichrolism to determine conformation or affinity chromatography columns to purify the protein, cloning or sequencing. The present sequence is Sistrurus miliarius venom gland
                                                                                                                                                                                                                                            protein, Zsnk4 gene.

```
The invention relates to new pigmy rattlesnake (Sistrurus miliarius)
venom gland proteins, which affect blood coagulation and platelet
aggregation system. The polypeptides, which affect blood coagulation and
platelet aggregation system, are useful in therapy and diagnostics. The
polypeptides are also useful as an educational tool in laboratory
protein chemistry and antibody production and analysis. The
polynucleotide or polypeptide can be used as standards or as unknowns
for testing purposes. The polypeptides are also useful in identifying
protein by western blotting, protein purification, determining the
weight of expressed polypeptides as a ratio to total protein expressed,
identifying peptide cleavage sites, coupling amino and carboxyl terminal
tags, mass spectrometry, circular dichroism to determine conformation or
affinity chromatography columns to purify the protein, cloning or
sequencing. The present sequence is Sistrurus miliarius venom gland
protein Zsnk3, degenerate nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          IleGluTrpSerAspGlySerSerIleSerLysGluAsnTrpIleGluGluGluSerLys 100

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to new pigmy rattlesnake (Sistrurus miliarius)
venom gland proteins, which affect blood coagulation and platelet
aggregation system. The polypeptides, which affect blood coagulation and
platelet aggregation system, are useful in therapy and diagnostics. The
polypeptides are also useful as an educational tool in laboratory
practical kits for courses related to genetics and molecular biology,
protein chemistry and antibody production and analysis. The polymelectide or polypeptide can be used as standards or as unknowns
for testing purposes. The polypeptides are also useful in identifying
porting purposes. The polypeptides are also useful in identifying
for testing purposes are polypeptides are also useful in identifying
to protein by western blotting, protein purification, determining the weight of expressed polypeptides as a ratio to total protein expressed, identifying peptide cleavage sites, coupling amino and carboxyl terminal tags, mass spectrometry, circular dichroism to determine conformation or affinity chromatography columns to purify the protein, cloning or sequencing. Zenk5 gene.

The invention relates to new pigmy rattlesnake (Sistrurus miliarius)
venom gland proteins, which affect blood coagulation and platelet
aggregation system. The polypeptides, which affect blood coagulation and
platelet aggregation system, are useful in therapy and diagnostics. The
polypeptides are also useful as an educational tool in laboratory
protein chemistry and antibody production and analysis. The
polymuclectide or polypeptide can be used as standards or as unknowns
for testing purposes. The polypeptides are also useful in identifying
for testing purposes. The polypeptides are also useful in identifying
protein by western blotting, protein purification, determining the
weight of expressed polypeptides as a ratio to total protein expressed,
identifying peptide cleavage sites, coupling amino and carboxyl terminal
tags, mass spectrometry, circular dichroism to determine conformation or
affinity chromatography columns to purify the protein, cloning or
sequencing. The present sequence is Sistrurus miliarius venom gland
protein Zsnk4, degenerate nucleic acid.

The invention relates to new pigmy rattlesnake (Sistrurus miliarius)
venom gland proteins, which affect blood coagulation and platelet
aggregation system. The polyreptides, which affect blood coagulation and
platelet aggregation system, are useful in therapy and diagnostics. The
polypeptides are also useful as an educational tool in laboratory
protein chemistry and antibody production and analysis. The
polymucleotide or polypeptide an be used as standards or as unknowns
polymucleotide or polypeptide and be used as standards or as unknowns
for testing purposes. The polypeptides are also useful in identifying
proteins by western blotting, protein purification, determining the
weight of expressed polypeptides as a ratio to total protein expressed,
identifying peptide cleavage sites, coupling amino and carboxyl terminal
tags, mass spectrometry, circular dichroism to determine conformation or
affinity chromatography columns to purify the protein, cloning or
sequencing. The present sequence is Sistrurus miliarius venom gland
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 AspCysSerSerAspTrpSerSerTyrGluGlyHisCysTyrLysValPheLysGlnSer 20

These peptides have the advantage of avoiding significant thrombocytopenia when administered at the minimum dose, for in vivo inhibition of platelet von Willebrand factor binding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to halyxin, a novel protein with very strong blood antioorgulation activity. The protein was separated from snake venom of Agkistrodon halys brevicaudus (a Korean pit viper) and can be used in the treatment of thrombogenesis. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Halyxin as blood anticoagulation protein separated from snake venom
                                                                                                                                                                                                                                                                                                                                                  Snake; pit viper; venom; halyxin; anticoagulant; thrombogenesis;

peptide originating from a polymer protein with disulphide bonds within and between subunits. The method comprises denaturing the protein or its subunit using a protein denaturing agent in a solution, removing the agent in the presence of a polyoxyalkyl polyether which reacts with a thiol group and unwinds the subunit, and separating the polyoxyalkyl polyether-bound subunit peptide. The method can be used for producing physiologically-active subunit peptides for polymer proteins e.g. snake venom-originated dimer peptide with blood platelet-inhibitory activity on von Willebrand's factor. The peptides produced have platelet-binding inhibitory, and thrombolytic activity. The present sequence represents method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                         20

                                                                                                                                                                                                                                                                                   The invention relates to a glycoprotein 1b-binding protein, originating from snake venom, comprising specific mutations and antithrombotic activity. Glycoprotein Ib-binding protein is used in a drug having antithrombotic activity. Glycoprotein Ib-binding protein has a high binding activity to glycoprotein Ib-binding protein has a high binding activity to glycoprotein Ib, a long half life/drug efficacy retention in blood, and low antigenicity. This polynucleotide sequence represents DNA of the wild-type rattlesnake protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 AspCysSerSerAspTrpSerSerTyrGluGlyHisCysTyrLysValPheLysGlnSer

The invention comprises the nucleotide and protein sequences of a salmorin protein derived from the venom of Korean adder. Salmorin protein is composed of an A chain and a B chain, and has inhibitory activity against fibrinogen clotting. The salmorin protein of the invention is useful for treating thrombosis, as it represses fibrinogen clotting potently by binding to prothrombin and thrombin so as to delay blood coagulation. The present cDNA sequence encodes the Korean adder salmorin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 AspCysSerSerAspTrpSerSerTyrGluGlyHisCysTyrLysValPheLysGlnSer 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New salmorin protein derived from venom of Korean adder Agkistrodon halys brevicaudus, useful for treating thrombosis by repressing fibrinogen clotting through repression of activation of prothrombin into thrombin
                              Korean adder; ss; salmorin protein B chain; snake venom; fibrinogen clotting inhibition; thrombosis; prothrombin binding; thrombin binding; blood coagulation.
adder snake venom salmorin B chain protein cDNA sequence.
                                                                                                                                                                                                                                                                                                                                                        chain protein"

The invention relates to new pigmy rattlesnake (Sistrurus miliarius)
venom gland proteins, which affect blood coagulation and platelet
aggregation system. The polypeptides, which affect blood coagulation and
platelet aggregation system, are useful in therapy and diagnostics. The
platelet aggregation system, are useful in therapy and diagnostics. The
platelet aggregation system as educational tool in laboratory
protein chemistry and antibody production and analysis. The
polymucleotide or polypeptide can be used as standards or as unknowns
for testing purposes. The polypeptides are also useful in identifying
proteins by western blotting protein purification, determining the
weight of expressed polypeptides as a ratio to total protein expressed,
identifying peptide cleavage sites, coupling amino and carboxyl terminal
tags, mass spectrometry, circular dichroism to determine conformation or
sequencing. The present sequence is Sistrurus miliarius venom gland
protein, 2snk2 gene.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5830670
GENERAL INFORMATION:
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
